DENOVA
TECHNOLOGIES LTD

MES

MES (Manufacturing Execution System)

China's first MES system will be equipped with 5G MEC,
enabling enterprises to establish smart workshops.

DENOVA
TECHNOLOGIES LTD

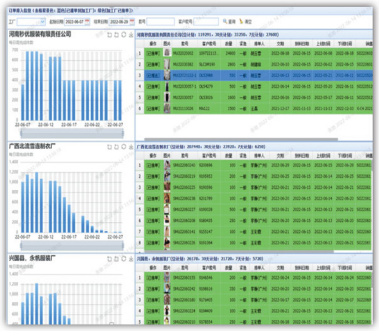

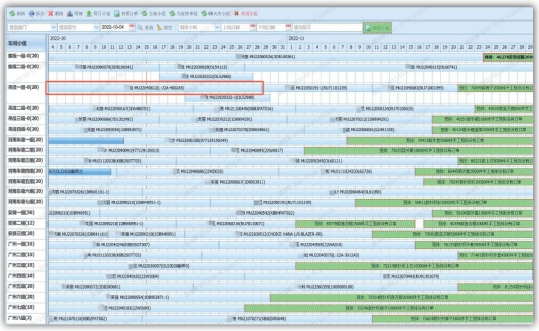

MU-MES System connects

All devices and drives the whole process of production.

Advanced planning and scheduling system

AI algorithms will perform based on learning curves & customer requirements, order types,material conditions, etc. Accurately match production capacity, generate accurate production plans, automatically track plan progress, and provide intelligent warnings to ensure order delivery time.

DENOVA
TECHNOLOGIES LTD

Leading Technology

01

**Technology integration drives intelligent manufacturing upgrades,
helping the apparel industry achieve flexible and rapid response and efficiency leaps**

Production Planning : Moving from "Experience-Driven" to "Data-Driven"

**Dynamically respond to changes in orders, automatically complete production scheduling
shorten line input time by upto 30 %, reduce rework rate more than 10%,
and achieve smart production planning.**

Full-process quality traceability: Every stitch & thread can be traced.

**By using RFID/QR codes,
MES can connect the production process, locate responsibile point within seconds
Achieve the "known, visible, traceable, reliable , and controllable" process of total clothing production.**

Real-time data dashboard: making the production site "transparent"

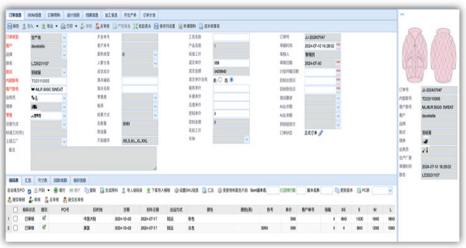

**Three level visual monitoring : U-PAD can monitor the real-time production data .
Visual management system for traffic lights,
Dynamically indicating order processing rates. Continuously displaying production and quality data.**

Product Functions

02

AI recognizes order information

Order information can be automatically recognized from images, PDFs, Excel , and Word documents using NLP entity recognition and other technologies for quick order entry. It can also be directly integrated with existing software.

GST Process Management

Establish internal process standard data, establish action standards and operation standards, standardize employee operations and enable good operation methods t.At the same time, assist in product quotation, production target setting, and production balance case studies to help enterprises improve efficiency.Realize process controllability, and decision dataization.

DENOVA
TECHNOLOGIES LTD

Kanban System

1. Visual Production Process

We have achieved full process visualization of production, from the cutting workshop, sewing assembly line, quality inspection and other links, through a convenient human-machine interaction system.

2. Production line Information

Through interactive methods such as cameras, barcode scanners, RFID cards, and smart screens, the informatization of production materials and processes intelligent information flow system.

3. Visual Quality Management

Using a Smart-PAD as a quality management terminal to collect quality data while conducting real-time analysis to achieve visual quality management.

4. Finishing Visualization

Proactively report and summarize data from different finishing departments to ensure that the team leader promptly understands the production capacity situation.

Benefit-Oriented

03

✓ 优化制造模式 **OPTIMIZED MANUFACTURING MODE**

Strengthen the process of management manufacturing, data sharing, and collaboration among various systems.

✓ 高效协作 **EFFICIENT COLLABORATION**

Real time comparison of employee performance and standard working hours, quickly identifying low efficiency.

✓ 数据可视化 **INFORMATION VISUALIZATION**

Real-time data analysis of all department. Quality data and perform analysis.

✓ 数字绩效系统 **DIGITAL PERFORMANCE SYSTEM**

Digital performance management involves breaking down company targets and using digital technology for visual management to improve target completion rates and employee enthusiasm.

✓ 质量可追溯 **PRODUCT TRACEABILITY**

Such things as manufacturing, materials, human resources, machines, assembly lines, finishing traceables,quantity, material sources, and quality tracking.

✓ 智能数据互通 **INTELLIGENT INTREGRATION**

This integration connects the IE team with sewing operators, ensuring transparent data and real output.

DENOVA
TECHNOLOGIES LTD

Cutting management.

The MES system enables full traceability from raw materials to finished products by recording cutting, laying, and bundling activities. It calculates fabric consumption, worker input, and equipment status, ultimately generating codes for tracing fabric shade and roll numbers, thus avoiding quality issues.

Sewing Management

The MES system creates a workstation balance map for each team using hanging and scanning data from tablets, showing the real-time status of production lines. IE engineers can analyze balance, identify bottlenecks, and quickly adjust workflow to improve efficiency.

Workstation & Traffic lights management

The U-pad enables attendance tracking, data communication, real-time production data, and piece rate wages. Traffic lights allow direct monitoring of production and quality, enhancing visual management and efficiency.

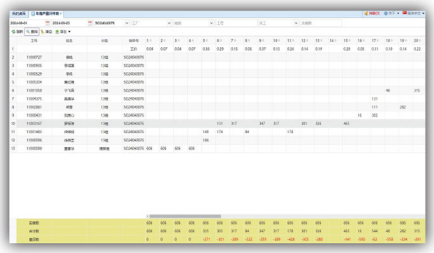

AGV intelligent scheduling & Auto packing

AGV sorts colors and codes to transport finished garments for packaging. MES plans packing and automates palletizing, integrating with WMS. Also,integrates a mainstream hanger system. Integration with conveyor system includes auto folding and auto ironing, providing total automation.

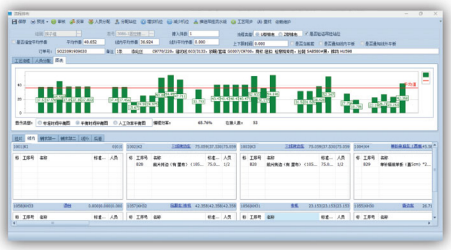

Digital Performance

Digital performance management breaks down company indicators, utilizing digital technology for visual management and dynamic monitoring. This enhances achievement rates and boosts employee motivation.

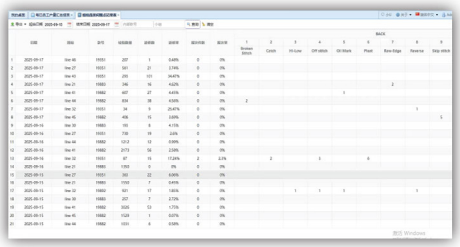

Multi-dimensional real-time data
